

**Example 5: Examine this two-planet situation:**

$$F_g = 4.1 \times 10^{21} \text{ N}$$

The above is now changed, as follows; find the new gravitational force in each case:

- (a)  $m$  is tripled.
- (b)  $M$  is tripled, and  $m$  is reduced by half.
- (c)  $M$  is one-tenth as large, and  $R$  is tripled.
- (d)  $m$  is quadrupled, and  $R = 9.5 \times 10^8 \text{ m}$ .

a)  $F \propto m$  so  $F_{\text{new}} = F_{\text{old}} \times \left[ \frac{m_{\text{new}}}{m_{\text{old}}} \right]$

$$F_{\text{new}} = 4.1 \times 10^{21} \left( \frac{3m}{m} \right)$$

$$F_{\text{new}} = 1.2 \times 10^{22} \text{ N}$$

b)  $F \propto M$ ,  $F \propto m$

$$\text{so } F_{\text{new}} = F_{\text{old}} \times \left[ \frac{M_{\text{new}}}{M_{\text{old}}} \right] \times \left[ \frac{m_{\text{new}}}{m_{\text{old}}} \right]$$

$$F_{\text{new}} = 4.1 \times 10^{21} \left( \frac{3M}{M} \right) \times \left( \frac{.5m}{m} \right)$$

$$F_{\text{new}} = 6.2 \times 10^{21} \text{ N}$$

continued next page . . .

$$c) F \propto M, F \propto \frac{1}{r^2}$$

$$\text{so } F_{\text{new}} = F_{\text{old}} \left[ \frac{M_{\text{new}}}{M_{\text{old}}} \right] \left[ \frac{r_{\text{old}}^2}{r_{\text{new}}^2} \right]$$

NOTE!

$$= 4.1 \times 10^{21} \left[ \frac{.1M}{M} \right] \left[ \frac{r^2}{(3r)^2} \right]$$

$$= 4.1 \times 10^{21} \left[ .1 \right] \left[ \frac{1}{9} \right]$$

$$F_{\text{new}} = 4.6 \times 10^{19} \text{ N}$$

$$d) F_{\text{new}} = 4.1 \times 10^{21} \left[ \frac{4 \cancel{\text{m}}}{\cancel{\text{m}}} \right] \left[ \frac{(1.4 \times 10^9)^2}{(9.5 \times 10^8)^2} \right]$$

$$F_{\text{new}} = 3.6 \times 10^{22} \text{ N}$$
